

Assignment:

You have been provided a dataset containing html source files of house advertisements on funda.nl. Each file contains the source code of a web page from the Dutch housing website <https://funda.nl>. The pages are all house advertisements in Dutch, so you might have to translate here and there. Funda.nl itself is also available in English, if you prefer, feel free to scrape a similar amount of pages from funda.nl in English yourself. All pages contain basic, generic information like 'House price', 'address' and 'square meters'. Some pages might contain additional information like 'Garage' or 'Exterior space'. An example page can be found here: <https://www.funda.nl/koop/winterswijk-meddo/huis-40819818-poolserweg-5/>

Your assignment is to parse the pages provided (or pages you scrape yourself from funda.nl), extracting all data present on each page concerning the house that is advertised on that page. Save your result to a .csv or .xlsx file so that it is easily human readable. The result data may either be in Dutch or English.
